

Identifying respondents

07/14/2025 9:06 am EDT

We use several methods for identifying and remembering respondents and combining each respondent's answers from multiple poll unit visits into one profile.

Cookies

Our most common identification mechanism is a cookie placed by the poll unit. After the respondent consents, they are assigned a long, random sequence of characters as their unique identifier. That identifier is then stored in a cookie. The cookie is associated with the civicscience.com domain. This cookie is considered first-party when accessing resources on civicscience.com and third-party when accessing a media partner's domain.

An increasing number of modern browsers disable third-party cookies by default or prohibit them entirely, and privacy-conscious users often install software that disables tracking with third-party cookies. For this reason, we provide another identification mechanism.

HTML5 local storage

We use HTML5 local storage to store a backup identifier for the respondent in case the cookie identifier is unavailable. The local storage identifier differs for each website, even for the same person. In other words, the same person will be treated as a different respondent on two different websites. However, for visitors who frequently visit the media partner's website, the local storage identifier is an effective fallback option that bypasses cookie restrictions.
